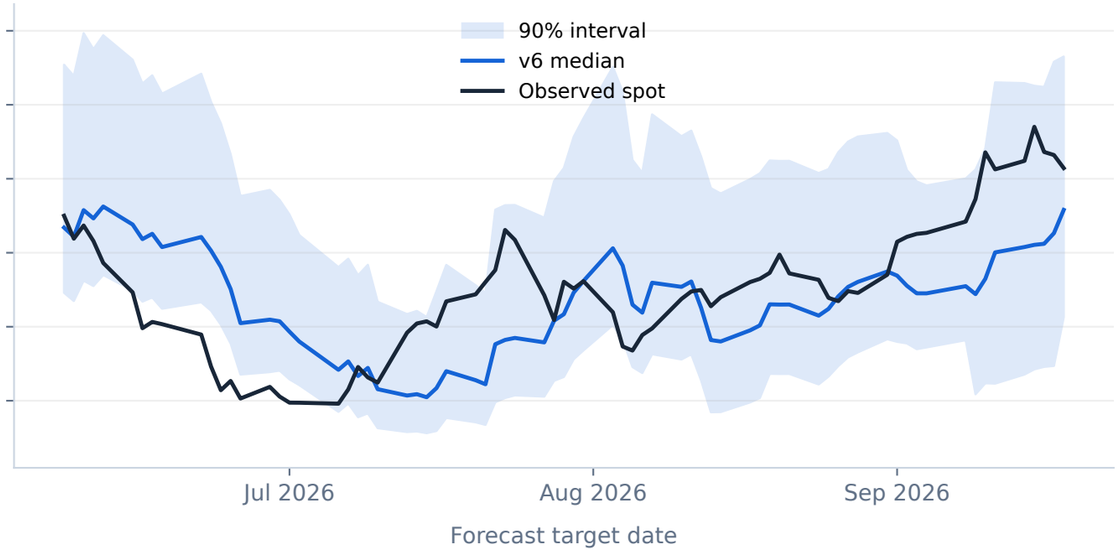
v6 historical 90% prediction intervals

Same June–September 2026 origins · Monthly calibration from previously published forecast errors

1-day | coverage 93.4% | n=76

5-day | coverage 79.2% | n=72



Risk calibration has a shorter evaluation window than point forecasts. The 5-day interval is 35% wider than v5; coverage still falls below 90%.

Development evidence only: the upgrade was selected using this history. Final October parameters remain frozen and unchanged.
